

Venu G Soganadgi

Senior Frontend Engineer · React, TypeScript, Palantir OSDK

8147638782 | soganadgivenu@gmail.com | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

PROFESSIONAL SUMMARY

Senior Frontend Engineer with 4+ years of experience architecting high-performance web applications and enterprise platforms. Proven track record as a lead React developer designing complex UI systems with Palantir React OSDK and integrating Palantir AIP for AI-driven workflows. Expert in TypeScript, parallel API orchestration, LLM schema validation, and state management, with a strong history of optimizing token usage, reducing technical debt, and accelerating cross-functional software delivery.

TECHNICAL SKILLS

Frontend Frameworks	React, Redux, Redux Toolkit, RTK Query, Redux-Saga, Formik, Yup, Material-UI, Tailwind CSS
Palantir Platform	React OSDK, AIP (Ontology objects, LLM blocks), Foundry-backed APIs
Languages	JavaScript (ES6+), TypeScript, HTML5, CSS3
DevOps & Tools	Git, GitHub, Azure Pipelines, CI/CD, Chrome DevTools, React DevTools
Engineering	REST API integration, JSON schema validation, localization (i18n), offline data storage

PROFESSIONAL EXPERIENCE

MathCo · Product Engineer II (FE)

08/2025 – Present

- Architected and developed a content generation web application as the sole frontend developer using Palantir React OSDK, streamlining Closed Loop Marketing (CLM) and Virtual Approved Email (VAE) presentation creation for pharmaceutical sales representatives.
- Designed client-side parallel API execution by triggering individual backend calls per slide, significantly decreasing total generation time, lowering token consumption, and eliminating cross-slide LLM hallucinations.
- Co-engineered Palantir AIP filter logic to query pre-analyzed Ontology slide objects based on user inputs (country, product, content type) and assisted in configuring LLM blocks to generate structured JSON outputs.
- Built an automated UI schema validator that parses LLM JSON payloads and automatically executes up to 3 retries on backend responses in case of validation failures.
- Optimized token cost and model usage by programmatically deriving structural slides (References, Definitions, Abbreviations) directly from slide JSON metadata instead of invoking extra LLM calls.
- Refactored e-Wizard compatible Vue.js codebases to consume dynamic JSON inputs, enabling reps to update presentation content without modifying template or index source code, and engineered dynamic template previews with multi-region localization across 5 countries and languages, including country-specific header and footer styling for VAEs.

Infosys · Technology Analyst / Senior System Engineer

10/2021 – 08/2025

- Built a greenfield React/TypeScript application end to end, delivering 4–5 complete user flows, deployed via Azure Pipelines CI/CD workflows.
- On a second enterprise product, shipped a new Q&A form feature and a custom left navigation with nested sub-trees, search, and deep linking into the main screen, alongside offline data storage and ongoing feature improvements.
- Slashed SonarQube code quality issues by 71% (from 700 to 200) by implementing strict coding standards and code reviews
- Architected global state management with Redux / Redux-Saga and designed a reusable UI component library using Formik and Yup.
- Partnered with cross-functional teams to build POCs, accelerate feature releases, and author technical architecture documentation.

OPEN SOURCE CONTRIBUTIONS

One Army Community Platform ([GitHub](#))

- Architected a reusable, accessible Pagination component with URL parameter state persistence to replace legacy infinite loading.
- Refactored SpaceProfile architecture into modular sub-components (MemberHistory, UserStatistics) to enhance mobile responsiveness.

- Optimized authentication redirection flows and root-level edit validation to improve user conversion and data hygiene

EDUCATION

B.E. in Electronics & Communication Engineering

Acharya Institute of Technology – Bangalore

Graduated 2021
